

NCP4624

150 mA, Wide Input Range, LDO Linear Voltage Regulator

The NCP4624 is a CMOS 150 mA LDO linear voltage regulator which features high input voltage range while maintaining low quiescent current 2 μ A typically. Several protection features like Current Limiting and Reverse Current Protection Circuit are fully integrated to create a versatile device suitable for the power source being in the standby-mode. A high maximum input voltage (11 V) and wide temperature range (-40°C to 85°C) makes the NCP4624 device with output capacitor as low as 0.1 μ F an ideal choice for industrial applications also a portable equipments powered by 2-cell Li-ion battery.

Features

- Operating Input Voltage Range: 2.5 V to Set $V_{\text{OUT}} + 6.5$ V, Max. 11 V
- Output Voltage Range: 1.2 to 5.5 V (available in 0.1 V steps)
- $\pm 2\%$ Output Voltage Accuracy
- Output Current: min. 150 mA
- Line Regulation: 0.02%/V
- Current Limit Circuit
- Available in SOT-23-5, UDFN4 1.0 x 1.0 mm and SC-88A Package
- Built-in Reverse Current Protection Circuit
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Home Appliances, Industrial Equipment
- Cable Boxes, Satellite Receivers, Entertainment Systems
- Car Audio Equipment, Navigation Systems
- Notebook Adaptors, LCD TVs, Cordless Phones and Private LAN Systems
- Battery-Powered Portable Communication Equipments

APPLICATION INFORMATION

A typical application circuit for NCP4624 series is shown in the Figure 39.

Figure 39. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 100 nF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4624. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 100 nF ceramic output decoupling capacitor is sufficient to achieve stable operation of the IC. If tantalum capacitor is used, and its ESR is high, the loop oscillation may result. The capacitor should be connected as close as possible to the output and ground pin. Larger values and lower ESR improves dynamic parameters.

Enable Operation

The enable pin CE may be used for turning the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull

down current source which assure off state of LDO in case the CE pin will stay floating. If the enable function is not needed connect CE pin to VIN.

The D version of the NCP4624 includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal Consideration

As a power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

Reverse Current Protection Circuit

Internal Reverse Current Circuitry stops the reverse current from VOUT pin to GND pin and VIN pin when VOUT goes higher than VIN voltage or VSET voltage. VSET means voltage given by voltage version. The parasitic diode of PMOS pass device is internally switched to reverse direction before VIN becomes lower than VOUT. The operation coverage of the Reverse Current Protection Circuit is $V_{OUT} > 1.5\text{ V}$. In order to avoid unstable behavior a hysteresis is created by different threshold of detecting voltage VREV_DET and releasing voltage VREV_REL. See Figures 40 and 41 for details of configuration.

ESR versus Output Current

When using the NCP4624 devices, consider the following points:

- The relation between Output Current I_{OUT} and ESR of the output capacitor are shown below in Figures 42, 43 and 44.

- The conditions when the device performs stable operation are marked as the hatched area in the charts.
