CMOS

F²MC-8FX MB95390H Series

MB95F394H/F396K/F398H/F394K/F396H/F398K

■ DESCRIPTION

MB95390H is a series of general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers of this series contain a variety of peripheral resources.

Note: F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

■ FEATURES

- F²MC-8FX CPU core
  Instruction set optimized for controllers
  - Multiplication and division instructions
  - 16-bit arithmetic operations
  - Bit test branch instructions
  - Bit manipulation instructions, etc.
- Clock
  - Selectable main clock source
    Main OSC clock (up to 16.25 MHz, maximum machine clock frequency: 8.125 MHz)
    External clock (up to 32.5 MHz, maximum machine clock frequency: 16.25 MHz)
    Main CR clock (1/8/10/12.5 MHz ±2% or ±2.5%*, maximum machine clock frequency: 12.5 MHz)
    *: The main CR clock oscillation accuracy of a product in LQFP package (FPT-48P-M49 or FPT-52P-M02) is ±2% and that of a product in QFN package (LCC-48P-M11) is ±2.5%.
  - Selectable subclock source
    Sub-OSC clock (32.768 kHz)
    External clock (32.768 kHz)
    Sub-CR clock (Typ: 100 kHz, Min: 50 kHz, Max: 200 kHz)
- Timer
  - 8/16-bit composite timer × 2 channels
  - 8/16-bit PPG × 3 channels
  - 16-bit PPG × 1 channel (can work independently or together with the multi-pulse generator)
  - 16-bit reload timer × 1 channel (can work independently or together with the multi-pulse generator)
  - Time-base timer × 1 channel
  - Watch prescaler × 1 channel

(Continued)

For the information for microcontroller supports, see the following website.

http://edevice.fujitsu.com/micom/en-support/

FUJITSU

(Continued)

- UART/SIO × 1 channel
  - Full duplex double buffer
  - Capable of clock-asynchronous (UART) serial data transfer and clock-synchronous (SIO) serial data transfer
- I²C × 1 channel
  - Built-in wake-up function
- Multi-pulse generator (MPG) (for DC motor control) × 1 channel
  - 16-bit reload timer × 1 channel
  - 16-bit PPG timer × 1 channel
  - Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function)
- LIN-UART
  - Full duplex double buffer
  - Capable of clock-synchronous serial data transfer and clock-asynchronous serial data transfer
- External interrupt × 8 channels
  - Interrupt by edge detection (rising edge, falling edge, and both edges can be selected)
  - Can be used to wake up the device from different low power consumption (standby) modes
- 8/10-bit A/D converter × 12 channels
  - 8-bit and 10-bit resolution can be chosen.
- Low power consumption (standby) modes
  - Stop mode
  - Sleep mode
  - Watch mode
  - Time-base timer mode
- I/O port
  - MB95F394H/F396H/F398H (maximum no. of I/O ports: 44)
    General-purpose I/O ports (N-ch open drain)   : 3
    General-purpose I/O ports (CMOS I/O)   : 41
  - MB95F394K/F396K/F398K (maximum no. of I/O ports: 45)
    General-purpose I/O ports (N-ch open drain)   : 4
    General-purpose I/O ports (CMOS I/O)   : 41
- On-chip debug
  - 1-wire serial control
  - Serial writing supported (asynchronous mode)
- Hardware/software watchdog timer
  - Built-in hardware watchdog timer
  - Built-in software watchdog timer
- Low-voltage detection reset circuit
  - Built-in low-voltage detector
- Clock supervisor counter
  - Built-in clock supervisor counter function
- Programmable port input voltage level
  - CMOS input level / hysteresis input level
- Dual operation Flash memory
  - The erase/write operation and the read operation can be executed in different banks (upper bank/lower bank) simultaneously.
- Flash memory security function
  - Protects the content of the Flash memory

FUJITSU

■ PRODUCT LINE-UP

Part number Parameter	MB95F394H	MB95F396H	MB95F398H	MB95F394K	MB95F396K	MB95F398K
Type	Flash memory product					
Clock supervisor counter	It supervises the main clock oscillation.					
Program ROM capacity	20 Kbyte	36 Kbyte	60 Kbyte	20 Kbyte	36 Kbyte	60 Kbyte
RAM capacity	496 bytes	1008 bytes	2032 bytes	496 bytes	1008 bytes	2032 bytes
Low-voltage detection reset	No			Yes		
Reset input	Dedicated			Selected through software		
CPU functions	• Number of basic instructions : 136 • Instruction bit length : 8 bits • Instruction length : 1 to 3 bytes • Data bit length : 1, 8 and 16 bits • Minimum instruction execution time : 61.5 ns (with machine clock frequency = 16.25 MHz) • Interrupt processing time : 0.6 μs (with machine clock frequency = 16.25 MHz)					
General-purpose I/O	• I/O ports (Max) : 44 • CMOS I/O : 41 • N-ch open drain: 3			• I/O ports (Max) : 45 • CMOS I/O : 41 • N-ch open drain: 4		
Time-base timer	Interval time: 0.256 ms to 8.3 s (with external clock frequency = 4 MHz)					
Hardware/ software watchdog timer	• Reset generation cycle 　-　Main oscillation clock at 10 MHz: 105 ms (Min) • The sub-CR clock can be used as the source clock of the hardware watchdog timer.					
Wild register	It can be used to replace three bytes of data.					
LIN-UART	• A wide range of communication speeds can be selected by a dedicated reload timer. • Clock-synchronous serial data transfer and clock-asynchronous serial data transfer is enabled. • The LIN function can be used as a LIN master or a LIN slave.					
8/10-bit A/D converter	12 channels					
	8-bit resolution and 10-bit resolution can be chosen.					
8/16-bit composite timer	2 channels					
	• The timer can be configured as an "8-bit timer × 2 channels" or a "16-bit timer × 1 channel". • It has the following functions: timer function, PWC function, PWM function and input capture function. • Count clock: it can be selected from internal clocks (seven types) and external clocks. • It can output square wave.					
External interrupt	8 channels					
	• Interrupt by edge detection (The rising edge, falling edge, or both edges can be selected.) • It can be used to wake up the device from different standby modes.					
On-chip debug	• 1-wire serial control • It supports serial writing. (asynchronous mode)

Part number Parameter	MB95F394H	MB95F396H	MB95F398H	MB95F394K	MB95F396K	MB95F398K
UART/SIO	1 channel • Data transfer with UART/SIO is enabled. • It has a full duplex double buffer, variable data length (5/6/7/8 bits), a built-in baud rate generator and an error detection function. • It uses the NRZ type transfer format. • LSB-first data transfer and MSB-first data transfer are available to use. • Clock-asynchronous (UART) serial data transfer and clock-synchronous (SIO) serial data transfer is enabled.					
I^2C	1 channel • Master/slave transmission and receiving • It has the following functions: bus error function, arbitration function, transmission direction detection function, wake-up function, and functions of generating and detecting repeated START conditions.					
8/16-bit PPG	3 channels • Each channel of PPG can be used as two 8-bit PPG channels or a single 16-bit PPG channel. • The counter operating clock can be selected from eight clock sources.					
16-bit PPG	• PWM mode and one-shot mode are available to use. • The counter operating clock can be selected from eight clock sources. • It supports external trigger start. • It can work independently or together with the multi-pulse generator.					
16-bit reload timer	• Two clock modes and two counter operating modes are available to use. • It can output square waveform. • Count clock: it can be selected from internal clocks (seven types) and external clocks. • Two counter operating modes: reload mode and one-shot mode • It can work independently or together with the multi-pulse generator.					
Multi-pulse generator (for DC motor control)	• 16-bit PPG timer: 1 channel • 16-bit reload timer operations: toggle output, one-shot output • Event counter: 1 channel • Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function)					
Watch prescaler	Eight different time intervals can be selected.					
Flash memory	• It supports automatic programming, Embedded Algorithm, and write/erase/erase-suspend/erase-resume commands. • It has a flag indicating the completion of the operation of Embedded Algorithm. • Number of write/erase cycles: 100000 • Data retention time: 20 years • Flash security feature for protecting the content of the Flash memory					
Standby mode	Sleep mode, stop mode, watch mode, time-base timer mode

■ DIFFERENCES AMONG PRODUCTS AND NOTES ON PRODUCT SELECTION

• Current consumption

When using the on-chip debug function, take account of the current consumption of flash erase/write.

For details of current consumption, see "■ ELECTRICAL CHARACTERISTICS".

• Package

For details of information on each package, see "■ PACKAGES AND CORRESPONDING PRODUCTS" and "■ PACKAGE DIMENSIONS".
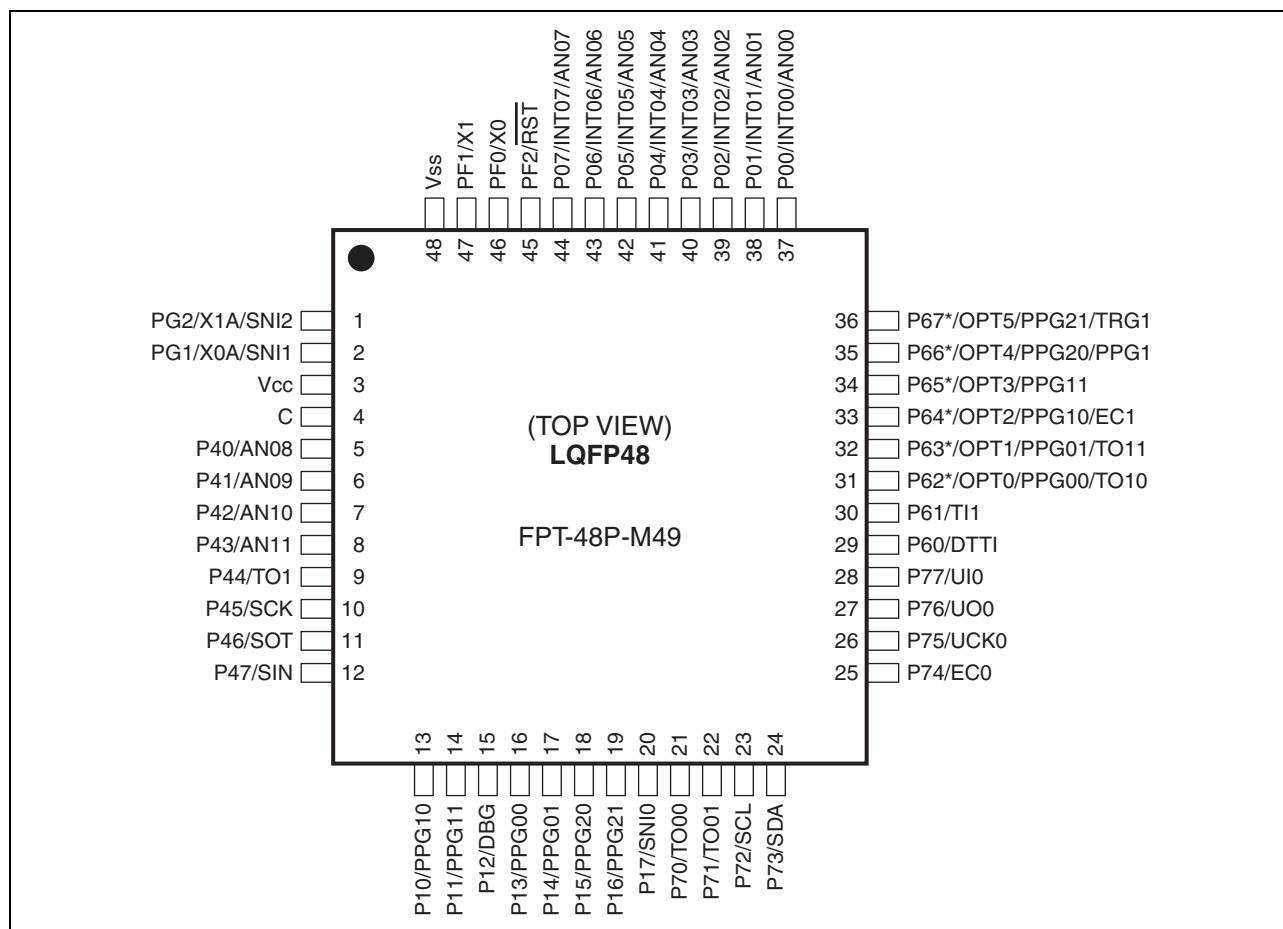

• Operating voltage

The operating voltage varies, depending on whether the on-chip debug function is used or not.

For details of the operating voltage, see "■ ELECTRICAL CHARACTERISTICS".

• On-chip debug function

The on-chip debug function requires that V_{CC}, V_{SS} and one serial wire be connected to an evaluation tool. For details of the connection method, refer to "CHAPTER 29 EXAMPLE OF SERIAL PROGRAMMING CONNECTION" in the hardware manual of the MB95390H Series.

■ PIN FUNCTIONS

Pin no.			Pin name	I/O circuit type*4	Function
LQFP48*1	QFN48*2	LQFP52*3			
1	1	1	PG2	C	General-purpose I/O port
			X1A		Subclock I/O oscillation pin
			SNI2		Trigger input pin for the position detection function of the MPG waveform sequencer
2	2	2	PG1	C	General-purpose I/O port
			X0A		Subclock input oscillation pin
			SNI1		Trigger input pin for the position detection function of the MPG waveform sequencer
3	3	3	Vcc	—	Power supply pin
4	4	4	C	—	Capacitor connection pin
5	5	5	P40	K	General-purpose I/O port
			AN08		A/D converter analog input pin
6	6	6	P41	K	General-purpose I/O port
			AN09		A/D converter analog input pin
—	—	7	NC	—	It is an internally connected pin. Always leave it unconnected.
7	7	8	P42	K	General-purpose I/O port
			AN10		A/D converter analog input pin
8	8	9	P43	K	General-purpose I/O port
			AN11		A/D converter analog input pin
9	9	10	P44	G	General-purpose I/O port
			TO1		16-bit reload timer ch. 0 output pin
10	10	11	P45	G	General-purpose I/O port
			SCK		LIN-UART clock I/O pin
11	11	12	P46	G	General-purpose I/O port
			SOT		LIN-UART data output pin
12	12	13	P47	J	General-purpose I/O port
			SIN		LIN-UART data input pin
13	13	14	P10	G	General-purpose I/O port
			PPG10		8/16-bit PPG ch. 1 output pin
14	14	15	P11	G	General-purpose I/O port
			PPG11		8/16-bit PPG ch. 1 output pin
15	15	16	P12	H	General-purpose I/O port
			DBG		DBG input pin
16	16	17	P13	G	General-purpose I/O port
			PPG00		8/16-bit PPG ch. 0 output pin

■ NOTES ON DEVICE HANDLING

• Preventing latch-ups
  When using the device, ensure that the voltage applied does not exceed the maximum voltage rating.
  In a CMOS IC, if a voltage higher than V_{CC} or a voltage lower than V_{SS} is applied to an input/output pin that is neither a medium-withstand voltage pin nor a high-withstand voltage pin, or if a voltage out of the rating range of power supply voltage mentioned in "1. Absolute Maximum Ratings" of "■ ELECTRICAL CHARAC-TERISTICS" is applied to the V_{CC} pin or the V_{SS} pin, a latch-up may occur.
  When a latch-up occurs, power supply current increases significantly, which may cause a component to be thermally destroyed.

• Stabilizing supply voltage
  Supply voltage must be stabilized.
  A malfunction may occur when power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the V_{CC} power supply voltage.
  As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in V_{CC} ripple (p-p value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard V_{CC} value, and the transient fluctuation rate does not exceed 0.1 V/ms at a momentary fluctuation such as switching the power supply.

• Notes on using the external clock
  When an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from subclock mode or stop mode.

■ PIN CONNECTION

• Treatment of unused pins
  If an unused input pin is left unconnected, a component may be permanently damaged due to malfunctions or latch-ups. Always pull up or pull down an unused input pin through a resistor of at least 2 kΩ. Set an unused input/output pin to the output state and leave it unconnected, or set it to the input state and treat it the same as an unused input pin. If there is an unused output pin, leave it unconnected.

• Power supply pins
  To reduce unnecessary electro-magnetic emission, prevent malfunctions of strobe signals due to an increase in the ground level, and conform to the total output current standard, always connect the V_{CC} pin and the V_{SS} pin to the power supply and ground outside the device. In addition, connect the current supply source to the V_{CC} pin and the V_{SS} pin with low impedance.
  It is also advisable to connect a ceramic capacitor of approximately 0.1 µF as a bypass capacitor between the V_{CC} pin and the V_{SS} pin at a location close to this device.

• DBG pin
  Connect the DBG pin directly to an external pull-up resistor.
  To prevent the device from unintentionally entering the debug mode due to noise, minimize the distance between the DBG pin and the V_{CC} or V_{SS} pin when designing the layout of the printed circuit board.
  The DBG pin should not stay at "L" level after power-on until the reset output is released.

• $\overline{RST}$ pin
  Connect the $\overline{RST}$ pin directly to an external pull-up resistor.
  To prevent the device from unintentionally entering the reset mode due to noise, minimize the distance between the $\overline{RST}$ pin and the V_{CC} or V_{SS} pin when designing the layout of the printed circuit board.
 The $\overline{RST}$/PF2 pin functions as the reset input/output pin after power-on. In addition, the reset output of the $\overline{RST}$/PF2 pin can be enabled by the RSTOE bit in the SYSC register, and the reset input function and the general purpose I/O function can be selected by the RSTEN bit in the SYSC register.

• C pin
Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_S. For the connection to a smoothing capacitor C_S, see the diagram below. To prevent the device from unintentionally entering a mode to which the device is not set to transit due to noise, minimize the distance between the C pin and C_S and the distance between C_S and the V_{SS} pin when designing the layout of a printed circuit board.

• Memory Space

The memory space of the MB95390H Series is 64 Kbyte in size, and consists of an I/O area, a data area, and a program area. The memory space includes areas intended for specific purposes such as general-purpose registers and a vector table. The memory maps of the MB95390H Series are shown below.

• Memory Maps

0FEF$_H$	WICR	Interrupt pin control register	R/W	01000000$_B$
0FF0$_H$ to 0FFF$_H$	—	(Disabled)	—	—

• R/W access symbols
   R/W   : Readable / Writable
   R   : Read only
   W   : Write only

• Initial value symbols
   0   : The initial value of this bit is "0".
   1   : The initial value of this bit is "1".
   X   : The initial value of this bit is indeterminate.

Note: Do not write to an address that is "(Disabled)". If a "(Disabled)" address is read, an indeterminate value
         is returned.

■ INTERRUPT SOURCE TABLE

Interrupt source	Interrupt request number	Vector table address		Bit name of interrupt level setting register	Priority order of interrupt sources of the same level (occurring simultaneously)
		Upper	Lower		
External interrupt ch. 0, ch. 4	IRQ00	FFFA$_H$	FFFB$_H$	L00 [1:0]	High
External interrupt ch. 1, ch. 5	IRQ01	FFF8$_H$	FFF9$_H$	L01 [1:0]	
External interrupt ch. 2, ch. 6	IRQ02	FFF6$_H$	FFF7$_H$	L02 [1:0]

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6$	V	
Input voltage*1	V_I	$V_{SS} - 0.3$	$V_{SS} + 6$	V	*2
Output voltage*1	V_O	$V_{SS} - 0.3$	$V_{SS} + 6$	V	*2
Maximum clamp current	I_{CLAMP}	−2	+2	mA	Applicable to specific pins*3
Total maximum clamp current	$\Sigma|I_{CLAMP}|$	—	20	mA	Applicable to specific pins*3
"L" level maximum output current	I_{OL1}	—	15	mA	Other than P62 to P67
	I_{OL2}	—	15		P62 to P67
"L" level average current	I_{OLAV1}	—	4	mA	Other than P62 to P67 Average output current = operating current × operating ratio (1 pin)
	I_{OLAV2}	—	12		P62 to P67 Average output current = operating current × operating ratio (1 pin)
"L" level total maximum output current	ΣI_{OL}	—	100	mA	
"L" level total average output current	ΣI_{OLAV}	—	50	mA	Total average output current = operating current × operating ratio (Total number of pins)
"H" level maximum output current	I_{OH1}	—	−15	mA	Other than P12, P62 to P67, P72, P73 and PF2
	I_{OH2}	—	−15		P12, P62 to P67, P72, P73 and PF2
"H" level average current	I_{OHAV1}	—	−4	mA	Other than P12, P62 to P67, P72, P73 and PF2 Average output current = operating current × operating ratio (1 pin)
	I_{OHAV2}	—	−8		P12, P62 to P67, P72, P73 and PF2 Average output current = operating current × operating ratio (1 pin)
"H" level total maximum output current	ΣI_{OH}	—	−100	mA	
"H" level total average output current	ΣI_{OHAV}	—	−50	mA	Total average output current = operating current × operating ratio (Total number of pins)
Power consumption	Pd	—	320	mW	
Operating temperature	T_A	−40	+85	°C	
Storage temperature	Tstg	−55	+150	°C	

(Continued)

(Continued)

*1: The parameter is based on $V_{SS} = 0.0$ V.

*2: V_I and V_O must not exceed $V_{CC} + 0.3$ V. V_I must not exceed the rated voltage. However, if the maximum current to/from an input is limited by means of an external component, the I_{CLAMP} rating is used instead of the V_I rating.

*3: Applicable to the following pins: P00 to P07, P10, P11, P13 to P17, P40 to P47, P60 to P67, P70, P71, P74 to P77, PF0, PF1, PG1 and PG2
 • Use under recommended operating conditions.
 • Use with DC voltage (current).
 • The HV (High Voltage) signal is an input signal exceeding the V_{CC} voltage. Always connect a limiting resistor between the HV (High Voltage) signal and the microcontroller before applying the HV (High Voltage) signal.
 • The value of the limiting resistor should be set to a value at which the current to be input to the microcontroller pin when the HV (High Voltage) signal is input is below the standard value, irrespective of whether the current is transient current or stationary current.
 • When the microcontroller drive current is low, such as in low power consumption modes, the HV (High Voltage) input potential may pass through the protective diode to increase the potential of the V_{CC} pin, affecting other devices.
 • If the HV (High Voltage) signal is input when the microcontroller power supply is off (not fixed at 0 V), since power is supplied from the pins, incomplete operations may be executed.
 • If the HV (High Voltage) input is input after power-on, since power is supplied from the pins, the voltage of power supply may not be sufficient to enable a power-on reset.
 • Do not leave the HV (High Voltage) input pin unconnected.
 • Example of a recommended circuit

 • Input/Output equivalent circuit
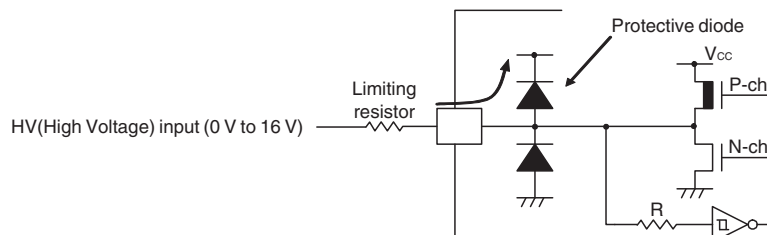

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

2. Recommended Operating Conditions

$(V_{SS} = 0.0 \text{ V})$

Parameter	Symbol	Value		Unit	Remarks	
		Min	Max			
Power supply voltage	V_{CC}	2.4[*1][*2]	5.5[*1]	V	In normal operation	Other than on-chip debug mode
		2.3	5.5		Hold condition in stop mode	
		2.9	5.5		In normal operation	On-chip debug mode
		2.3	5.5		Hold condition in stop mode	
Smoothing capacitor	C_S	0.022	1	µF	*3	
Operating temperature	T_A	−40	+85	°C	Other than on-chip debug mode	
		+5	+35		On-chip debug mode	

*1: The value varies depending on the operating frequency, the machine clock and the analog guaranteed range.

*2: This value becomes 2.88 V when the low-voltage detection reset is used.

*3: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V_{CC} pin must have a capacitance larger than C_S. For the connection to a smoothing capacitor C_S, see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C_S and the distance between C_S and the V_{SS} pin when designing the layout of a printed circuit board.

- DBG / $\overline{\text{RST}}$ / C pins connection diagram
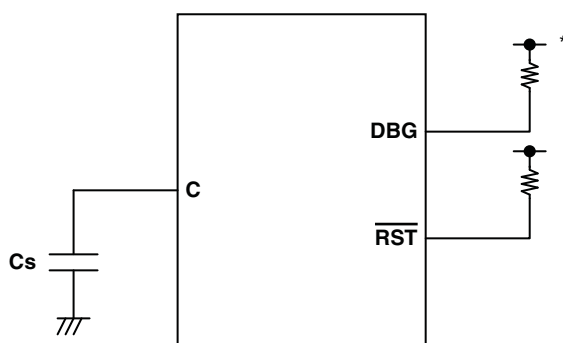

*: Since the DBG pin becomes a communication pin in on-chip debug mode, set a pull-up resistor value suiting the input/output specifications of P12/DBG.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

3. DC Characteristics

(V_{CC} = 5.0 V±10%, V_{SS} = 0.0 V, T_A = −40°C to +85°C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ[3]	Max		
"H" level input voltage	V_{IHI}	P47, P72, P73, P77	*1	0.7 V_{CC}	—	V_{CC} + 0.3	V	When CMOS input level (hysteresis input) is selected
	V_{IHS}	P00 to P07, P10 to P17, P40 to P47, P60 to P67, P70 to P77, PF0, PF1, PG1, PG2	*1	0.8 V_{CC}	—	V_{CC} + 0.3	V	Hysteresis input
	V_{IHM}	PF2	—	0.7 V_{CC}	—	V_{CC} + 0.3	V	Hysteresis input
"L" level input voltage	V_{IL}	P47, P72, P73, P77	*1	V_{SS} − 0.3	—	0.3 V_{CC}	V	When CMOS input level (hysteresis input) is selected
	V_{ILS}	P00 to P07, P10 to P17, P40 to P47, P60 to P67, P70 to P77, PF0, PF1, PG1, PG2	*1	V_{SS} − 0.3	—	0.2 V_{CC}	V	Hysteresis input
	V_{ILM}	PF2	—	V_{SS} − 0.3	—	0.3 V_{CC}	V	Hysteresis input
Open-drain output application voltage	V_D	P12, P72, P73, PF2	—	V_{SS} − 0.3	—	V_{SS} + 5.5	V	
"H" level output voltage	V_{OH1}	Output pins other than P12, P62 to P67, P72, P73, PF2	I_{OH} = −4 mA	V_{CC} − 0.5	—	—	V	
	V_{OH2}	P62 to P67	I_{OH} = −8 mA	V_{CC} − 0.5	—	—	V	
"L" level output voltage	V_{OL1}	Output pins other than P62 to P67	I_{OL} = 4 mA	—	—	0.4	V	
	V_{OL2}	P62 to P67	I_{OL} = 12 mA	—	—	0.4	V	
Input leak current (Hi-Z output leak current)	I_{LI}	All input pins	0.0 V < V_I < V_{CC}	−5	—	+5	µA	When pull-up resistance is disabled
Pull-up resistance	R_{PULL}	P00 to P07, P10, P11, P13 to P17, P40 to P47, P60, P61, P70, P71, P74 to P76, PG1, PG2	V_I = 0 V	25	50	100	kΩ	When pull-up resistance is enabled

(Continued)

$(V_{CC} = 5.0\ V\pm10\%, V_{SS} = 0.0\ V, T_A = -40°C\ to\ +85°C)$

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ[*3]	Max		
Power supply current[*2]	I_{CCTS}	V_{CC} (External clock operation)	V_{CC} = 5.5 V F_{CH} = 32 MHz Time-base timer mode T_A = +25°C	—	0.9	3	mA	
	I_{CCH}		V_{CC} = 5.5 V Substop mode T_A = +25°C	—	3.4	22.5	µA	
	I_{LVD}	V_{CC}	Current consumption for low-voltage detection circuit only	—	31	54	µA	
	I_{CRH}		Current consumption for the main CR oscillator	—	0.5	0.6	mA	
	I_{CRL}		Current consumption for the sub-CR oscillator oscillating at 100 kHz	—	20	72	µA	

*1: The input levels of P47, P72, P73 and P77 can be switched between "CMOS input level" and "hysteresis input level". The input level selection register (ILSR) is used to switch between the two input levels.

*2: • The power supply current is determined by the external clock. When the low-voltage detection option is selected, the power-supply current will be the sum of adding the current consumption of the low-voltage detection circuit (I_{LVD}) to one of the value from I_{CC} to I_{CCH}. In addition, when both the low-voltage detection option and the CR oscillator are selected, the power supply current will be the sum of adding up the current consumption of the low-voltage detection circuit, the current consumption of the CR oscillators (I_{CRH}, I_{CRL}) and a specified value. In on-chip debug mode, the CR oscillator (I_{CRH}) and the low-voltage detection circuit are always enabled, and current consumption therefore increases accordingly.
  • See "4. AC Characteristics: (1) Clock Timing" for F_{CH} and F_{CL}.
  • See "4. AC Characteristics: (2) Source Clock/Machine Clock" for F_{MP} and F_{MPL}.

*1: This is the clock before it is divided according to the division ratio set by the machine clock divide ratio select bits (SYCC:DIV1, DIV0). This source clock is divided to become a machine clock according to the divide ratio set by the machine clock divide ratio select bits (SYCC:DIV1, DIV0). In addition, a source clock can be selected from the following.
- Main clock divided by 2
- Main CR clock
- Subclock divided by 2
- Sub-CR clock divided by 2

*2: This is the operating clock of the microcontroller. A machine clock can be selected from the following.
- Source clock (no division)
- Source clock divided by 4
- Source clock divided by 8
- Source clock divided by 16

$\overline{RST}$ "L" level pulse width	t_{RSTL}	$2\ t_{MCLK}$*1	—	ns	In normal operation
		Oscillation time of the oscillator*2 + 100	—	µs	In stop mode, subclock mode, subsleep mode, watch mode, and power-on
		100	—	µs	In time-base timer mode

*1: See "(2) Source Clock/Machine Clock" for t_{MCLK}.

*2: The oscillation time of an oscillator is the time for it to reach 90% of its amplitude. The crystal oscillator has an oscillation time of between several ms and tens of ms. The ceramic oscillator has an oscillation time of between hundreds of µs and several ms. The external clock has an oscillation time of 0 ms. The CR oscillator clock has an oscillation time of between several µs and several ms.

Analog input voltage	V_{AIN}	V_{SS}	—	V_{CC}	V	

(2) Notes on Using the A/D Converter
• External impedance of analog input and its sampling time
   • The A/D converter has a sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the capacitor of the internal sample and hold circuit is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, considering the relationship between the external impedance and minimum sampling time, either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. In addition, if sufficient sampling time cannot be secured, connect a capacitor of about 0.1 μF to the analog input pin.

• Analog input equivalent circuit
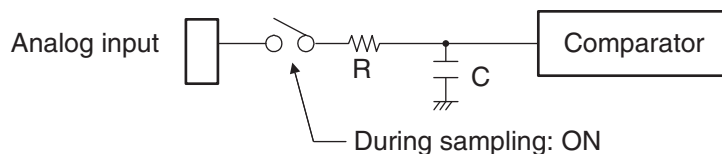

V$_{CC}$	R	C
4.5 V ≤ V$_{CC}$ ≤ 5.5 V	1.95 kΩ (Max)	17 pF (Max)
4.0 V ≤ V$_{CC}$ < 4.5 V	8.98 kΩ (Max)	17 pF (Max)

Note: The values are reference values.

• Relationship between external impedance and minimum sampling time
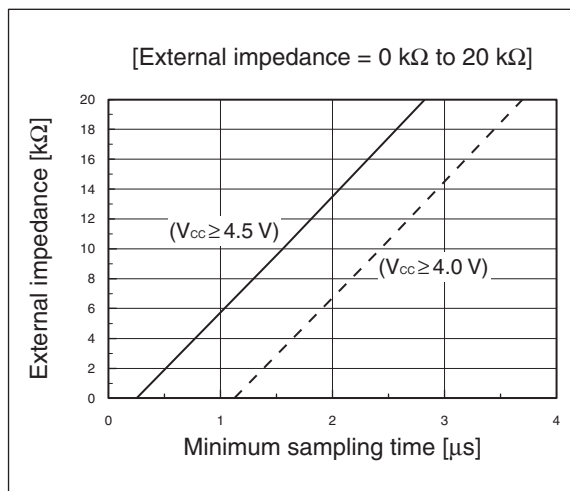

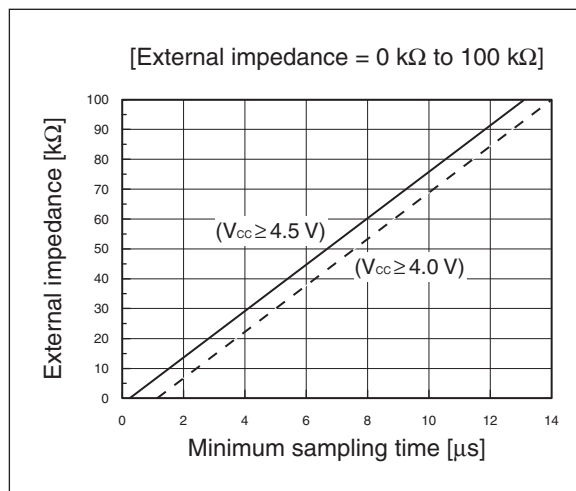

• A/D conversion error

   As |V$_{CC}$–V$_{SS}$| decreases, the A/D conversion error increases proportionately.

FUJITSU

(3) Definitions of A/D Converter Terms

- Resolution

  It indicates the level of analog variation that can be distinguished by the A/D converter.

  When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.

- Linearity error (unit: LSB)

  It indicates how much an actual conversion value deviates from the straight line connecting

  the zero transition point ("00 0000 0000" $\leftarrow \rightarrow$ "00 0000 0001") of a device to

  the full-scale transition point ("11 1111 1111" $\leftarrow \rightarrow$ "11 1111 1110") of the same device.

- Differential linear error (unit: LSB)

  It indicates how much the input voltage required to change the output code by 1 LSB deviates from an ideal value.

- Total error (unit: LSB)

  It indicates the difference between an actual value and a theoretical value. The error can be caused by a zero transition error, a full-scale transition errors, a linearity error, a quantum error, or noise.

$$1\ \text{LSB} = \frac{V_{CC} - V_{SS}}{1024}\ (V)$$

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (N - 1) + 0.5\ \text{LSB}\}}{1\ \text{LSB}}\ [\text{LSB}]$$

N : A/D converter digital output value

V_{NT} : Voltage at which the digital output transits from $(N - 1)_H$ to N_H

(Continued)

(Continued)

Zero transition error

Full-scale transition error
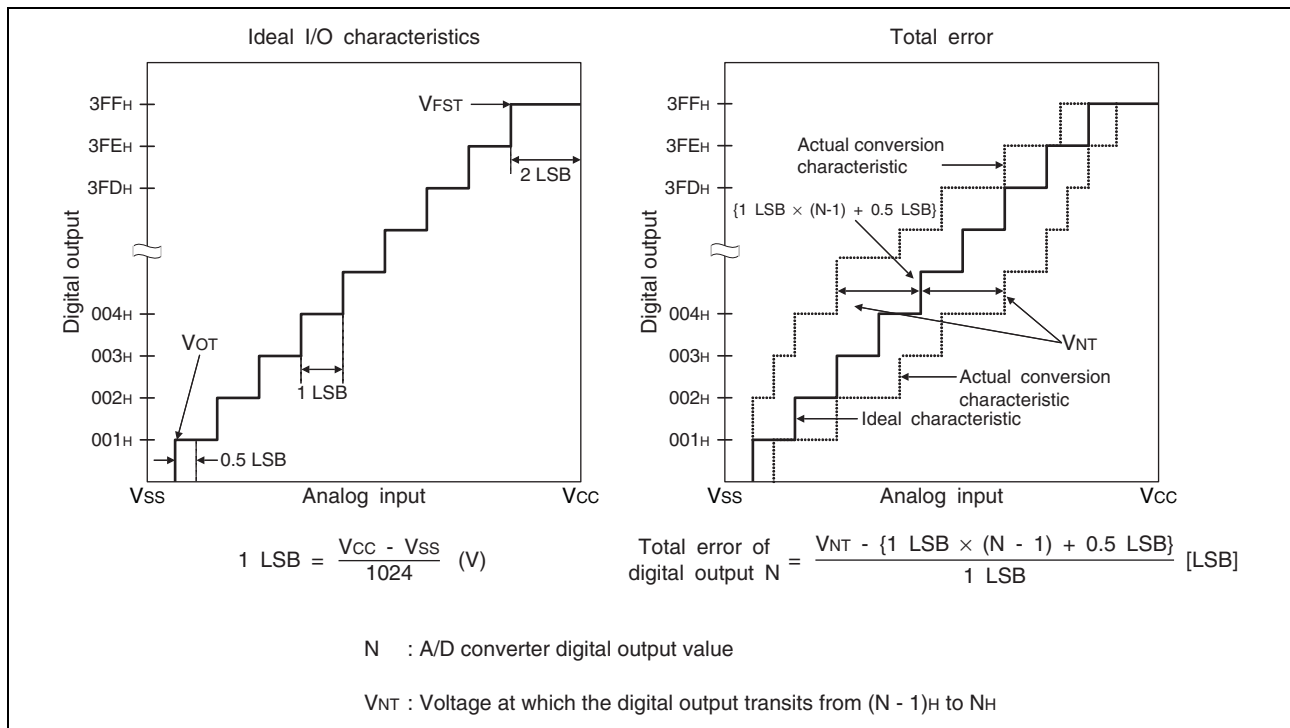

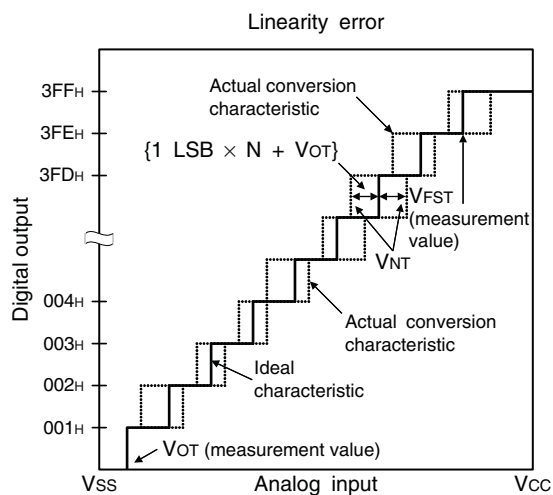

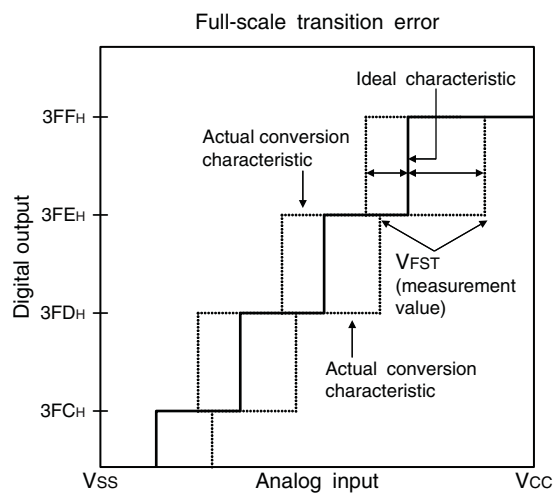

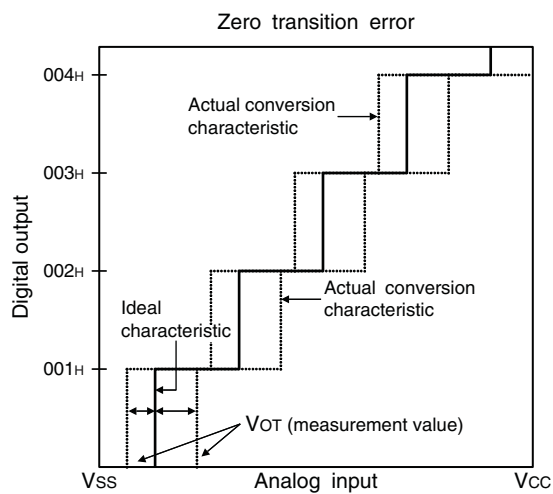

Linearity error

$$\text{Linearity error of digital output N} = \frac{V_{NT} - \{1\ LSB \times N + V_{OT}\}}{1\ LSB}$$

Differential linearity error
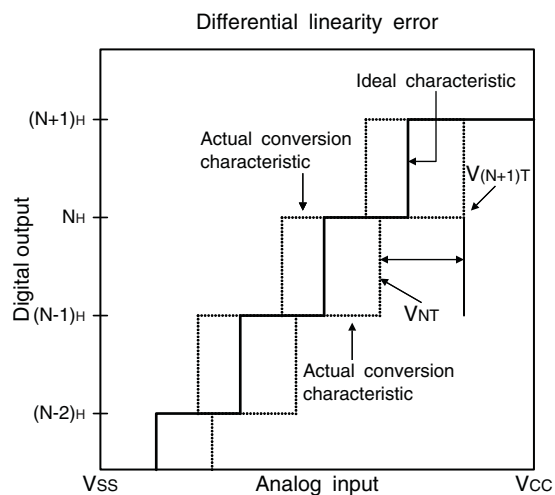

$$\text{Differential linear error of digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1\ LSB} - 1$$

N : A/D converter digital output value

V_{NT} : Voltage at which the digital output transits from $(N-1)_H$ to N_H

V_{OT} (ideal value) = V_{SS} + 0.5 LSB [V]

V_{FST} (ideal value) = V_{CC} - 2 LSB [V]

6.   Flash Memory Write/Erase Characteristics

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time (2 Kbyte sector)	—	0.2*1	0.5*2	s	The time of writing 00$_H$ prior to erasure is excluded.
Sector erase time (16 Kbyte sector)	—	0.5*1	7.5*2	s	The time of writing 00$_H$ prior to erasure is excluded.
Byte writing time	—	21	6100*2	µs	System-level overhead is excluded.
Erase/write cycle	100000	—	—	cycle	
Power supply voltage at erase/write	3.0	—	5.5	V	
Flash memory data retention time	20*3	—	—	year	Average T_A = +85°C

*1: T_A = +25°C, V_{CC} = 5.0 V, 100000 cycles

*2: T_A = +85°C, V_{CC} = 3.0 V, 100000 cycles

*3: This value is converted from the result of a technology reliability assessment. (The value is converted from the result of a high temperature accelerated test using the Arrhenius equation with the average temperature being +85°C).

■ SAMPLE CHARACTERISTICS

■ PACKAGE DIMENSION

48-pin plastic LQFP	Lead pitch	0.50 mm
	Package width × package length	7.00 mm × 7.00 mm
	Lead shape	Gullwing
	Lead bend direction	Normal bend
	Sealing method	Plastic mold
	Mounting height	1.70 mm MAX
(FPT-48P-M49)	Weight	0.17 g

48-pin plastic LQFP
(FPT-48P-M49)

Note 1) * : These dimensions do not include resin protrusion.
Note 2) Pins width and pins thickness include plating thickness.
Note 3) Pins width do not include tie bar cutting remainder.

■ MAJOR CHANGES IN THIS EDITION

Page	Section	Details
1	■ FEATURES	Changed the main CR clock oscillation accuracy. ±2% → ±2% or ±2.5% Added a remark about the main CR clock accuracy.
4	■ PRODUCT LINE-UP	Added FPT-52P-M02.
5	■ PACKAGES AND CORRESPONDING PRODUCTS	Added FPT-52P-M02.
6	■ DIFFERENCES AMONG PRODUCTS AND NOTES ON PRODUCT SELECTION	Added a reference for the connection method in "• On-chip debug function".
8	■ PIN ASSIGNMENT	Added the pin assignment diagram of FPT-52P-M02.
10 to 13	■ PIN FUNCTIONS	Added the pin numbers of FPT-52P-M02.
34	■ ELECTRICAL CHARACTERISTICS 4. AC Characteristics (1) Clock Timing	Changed the values of clock frequency (F_{CRH}). Added conditions related to the LQFP package and the QFN package for the values of clock frequency (F_{CRH}). Added footnotes *2 and *3.
58 to 63	■ SAMPLE CHARACTERISTICS	Added "■ SAMPLE CHARACTERISTICS".
65	■ ORDERING INFORMATION	Added the part numbers of FPT-52P-M02.
67	■ PACKAGE DIMENSION	Added the package diagram of FPT-52P-M02.

The vertical lines marked on the left side of the page indicate the changes.
